

Forensic Audit of Your Invoice-Intellect Mobile Web App From the Screen Recording

Evidence base

This analysis is based only on the uploaded iOS screen recording (03:18.8 total duration). Tap indicators are not visible in the recording, so “each click” is reconstructed from screen transitions, modal appearances, system sheets (iOS file picker / share sheets), and state changes in the UI.

The app is being used inside Safari as a mobile web app (address bar visible throughout), not as an installed PWA/native app. That fact materially affects scrolling, viewport sizing, safe-area handling, and file upload behaviour.

Interaction timeline reconstructed from the video

From 00:00–00:05, Safari is already opened on the app and the “Job Work” module is visible.

From 00:08–00:15, you switch within Job Work to “Challan Register” and then open “New Incoming Entry”.

From 00:18–00:28, you trigger an export download (“JobWork_Challans.xlsx”), then open the “AI Document Scanner” and reach iOS file selection.

From 00:41–00:53, the extracted “New Incoming Entry” contains at least two line items; totals on the Job Work dashboard change (Net Zinc Balance increases). You reopen the scanner again.

From 01:06–01:17, “AI is analyzing document...” completes and shows “Extraction Complete (Found 2 line items)”, then returns to the entry form where vendor and line items still look incorrect/partially empty; “Save Entry” is visible but partially obstructed.

From ~01:29 onward, you navigate into “Purchase Orders”; you trigger upload/scanning; processing runs; you later switch the PO filter to “Closed” and the list content does not match the filter state.

From ~02:52 onward, you open the invoice list module (Purchases/Sales-style list), trigger scanner/upload again; there is repeated jumping between app UI, iOS file picker, and scanner bottom sheets; the Sales module shows inconsistent filtering (“Needs Review” becomes an empty blank area). The video ends on a white blank screen.

Problem catalogue with fix instructions

Severity key used below:

- **S0 BLOCKER:** prevents basic use (scrolling, saving, navigation, blank screens)
- **S1 CRITICAL:** causes wrong accounting numbers or wrong records being created

- **S2 MAJOR:** significant UX breakage, confusing workflow, missing validations
- **S3 MINOR:** visual polish, consistency, wording

Category key used below:

- **U** = UI/Scrolling/Layout
- **W** = Workflow/Navigation
- **F** = File upload / camera capture integration
- **X** = Extraction/OCR correctness
- **D** = Data integrity / Business logic
- **P** = Performance / Reliability
- **E** = Export / Downloads

All timestamps are from the recording.

Issues and solutions

1. **[S0][U] Mobile Safari safe-area not handled; bottom UI is obstructed by Safari chrome. (00:05–end)**
 Fix: Use dynamic viewport units and safe-area insets everywhere. Implement `min-height: 100dvh` (not `100vh`) for main containers; add `padding-bottom: env(safe-area-inset-bottom)` to content and fixed bottom nav; reserve space for Safari bottom bar by adding a bottom spacer equal to `env(safe-area-inset-bottom)` plus nav height.
2. **[S0][U] Scroll becomes unreliable when bottom sheets are open; content is visually present but cannot be reached/dragged normally. (Multiple: 00:23.5, 00:35.7, 01:38+, 02:43+)**
 Fix: Implement a single scroll container strategy: `body { overflow: hidden; }` and a dedicated `.app-scroll` container with `overflow-y: auto; -webkit-overflow-scrolling: touch; height: 100dvh;`. When a modal is open, lock background scroll while allowing modal inner scroll.
3. **[S0][U] Modal stacking causes partial/ghost overlays and layered UI states. (00:35.7, 00:44.0, 01:38.4, 02:42.9)**
 Fix: Enforce “one modal at a time”. Introduce a global modal manager that guarantees: open → close previous; prevent multiple open states; clear modal state on route change; clear modal state on visibility change (`document.visibilitychange`) so coming back from file picker does not leave stale overlays.
4. **[S0][W] White/blank screen navigation failure happens at least twice. (01:34.5-ish blank transition, 03:16+ final white screen)**
 Fix: Add a global route error boundary. On any render exception, show a recovery screen with “Reload module” and log the stack trace. Add client-side monitoring and capture the failing route + state. Ensure any async loader sets failure state rather than rendering nothing.
5. **[S0][U] “Save Entry” call-to-action is partly hidden by Safari bottom bar, making saving unreliable. (01:17.0)**
 Fix: Move Save/Submit actions into a sticky footer inside the modal with safe-area padding, and ensure the modal content has bottom padding equal to footer height. Validate the footer is never covered by Safari.

6. [S0][U] Job Work entry form is taller than viewport and depends on scrolling inside a modal; modal scroll reliability is not guaranteed. (00:15.2, 00:41.1, 01:17.0)
Fix: Make modal content scrollable (`overflow-y:auto`) with a pinned header and pinned footer; never rely on background scroll for modal content.
7. [S1][D] Core zinc totals change immediately after extraction flows, even when extracted data is clearly incomplete. (00:49.9, 01:12.7)
Fix: Introduce "Draft" state. Extraction must create a draft only. Ledger totals must not update until explicit Save/Confirm after passing validations.
8. [S1][X] Extraction creates a "Zinc Ingot Received" line item with zero values; this looks like a false-positive extraction. (01:07.3, 01:17.0)
Fix: Add a post-extraction sanity filter: discard rows where (qty/pcs/weight/rate) are all zero or blank; mark as "suspected header/label" and require user confirmation before keeping.
9. [S1][X] Vendor changes between extractions without clear evidence ("Acme India Pvt Ltd." vs "Bharat Industrial"). (00:67.3 vs 01:17.0)
Fix: Vendor extraction must be confidence-driven. If confidence < threshold, do not auto-assign; show vendor candidates; allow user selection; store vendor master IDs; require manual confirm.
10. [S1][X] Document type classification is missing; zinc statement-like documents are being treated as challan/incoming entries. (01:01-01:10 and later behaviour suggests statements/sheets are being fed into challan pipeline)
Fix: Add a mandatory pre-step: classify document as one of {Tax Invoice Purchase, Tax Invoice Sales, Job Work Challan, PO, Zinc Statement/Analysis, Other}. Route extraction to the correct parser. If classification confidence is low, force user selection.
11. [S1][D] ZINC formula is applied even when the "Rate %" value is likely not a zinc rate for that item. (01:17.0 shows 6.2% on "MS Coupler Plate")
Fix: Bind zinc % rate to vendor/material rules, not generic extraction. Require zinc % to come from a configured table (vendor × product category × thickness range). If extracted % conflicts with config, flag as mismatch and force review.
12. [S1][D] "Net Zinc Balance" KPI can be distorted by bad extraction because drafts appear to affect totals. (00:49.9 onward)
Fix: Separate computed metrics into: Confirmed totals vs Draft totals. Display both clearly. Default KPI should be Confirmed only.
13. [S2][W] Two-level segmented controls in Job Work ("Incoming/Labour Cost" and "Vendor Balance/Challan Register") are visually ambiguous and easy to misinterpret as one control. (00:05-00:13)
Fix: Convert to a single tab bar with clear hierarchy: primary tabs on top; secondary filters inside each tab. Add active state stronger than a minor background change.
14. [S2][U] Inconsistent bottom navigation: sometimes icons-only, sometimes icons+labels. (00:05 vs 00:75.2 vs 01:29+)
Fix: Use one bottom nav design across all modules. If labels are shown, always show them. If not, never show them. Consistency is non-negotiable.

15. [S2][W] **Icon meaning is unclear: download, camera, plus are present without text labels. (Multiple)**
Fix: Add tooltips (on long press) and/or a labelled overflow menu. On mobile, replace three floating icons with one "Actions" button that opens a labelled sheet: {Scan, Upload PDF, New Manual Entry, Export}.
16. [S2][E] **Export triggers file download prompt but there is no in-app confirmation of what was exported, filters used, or date-range. (00:18.4)**
Fix: Before export: show exporter dialog with scope (current filter, date range). After export: show "Export ready" with file name and a "Copy link / Save to Files" step.
17. [S2][F] **"Use Camera" leads to iOS chooser (Photo Library / Take Photo / Choose File), not a dedicated scanner capture experience. (00:23.5, 01:41+, 01:01+)**
Fix: Implement an in-app camera scanner (web: `getUserMedia` + capture + crop; native: camera module). If staying web-only, explicitly label it "iOS will ask where to pick from" and default to "Take Photo".
18. [S2][F] **File ingest UI encourages "Upload File" but mobile Safari is showing photo-only privacy prompts; this misroutes users to photo picker. (01:02.6)**
Fix: Separate inputs: "Upload PDF" should accept only PDFs (`accept="application/pdf"`). "Upload image" should accept images. Do not use one file input for both.
19. [S2][F] **No visible indication of multi-page PDF support or page selection. (00:28.4 and other file picks)**
Fix: If PDF has multiple pages: show page thumbnails, allow selecting pages to extract, or extract all and merge line items with page references.
20. [S2][P] **"AI is analyzing document..." has no progress indicator, no timeout, no cancel that clearly aborts the backend job. (01:06.5, 02:36.0)**
Fix: Add progress states: upload → OCR → parse → validate. Include a real cancel that terminates server processing and clears UI state.
21. [S2][W] **"Extraction Complete" shows "Found 2 line items" but offers no explicit next action. (01:50_t110.2)**
Fix: Replace with "Review extracted data" primary button; "Discard draft" secondary; auto-advance to review screen after 1 second.
22. [S2][U] **Entry form shows delete icons per row but no confirmation, no undo, and no audit trail indicator. (01:17.0 and earlier forms)**
Fix: Add confirm/undo toast and a change log ("Row deleted (undo)"). Persist audit events.
23. [S2][X] **Key line-item fields remain blank after extraction (Thickness, Pcs) while computed fields are filled. (01:17.0)**
Fix: If extraction cannot populate required fields, the line item must be marked "Incomplete" and blocked from saving until completed or explicitly overridden.
24. [S2][X] **Lorry number and challan number extraction appears plausible (J/128, WB11C-8888), but there is no confidence or highlight of source. (00:67.3)**
Fix: Show confidence score and allow "tap to highlight source" on the document image/PDF page.

25. [S2][U] **Search bar placeholders vary in style ("Search...", "Search PO numbers...", "Search invoices...") without consistent pattern or icons. (00:05, 01:29, 02:52)**
Fix: Standardise search components across modules: same height, icon placement, placeholder format, debounce behaviour.
26. [S2][W] **Job Work dashboard card shows a formula but not the definitions of variables nor the period covered. (00:05+)**
Fix: Add a "?" info sheet: definitions of "Our WT", "Rate %", "Zinc received"; and date range filter visible in KPI area.
27. [S2][D] **Negative/positive zinc values appear in list cards without explanation (example: negative net zinc seen earlier in challan list). (00:10.0 shows a -1003.00 KG entry partly visible)**
Fix: Add explanation semantics: "Net zinc = consumed – received". Colour code with legend and allow drill-down.
28. [S2][U] **On multiple screens the vertical scroll indicator appears, but the content layout suggests nested containers and unpredictable scroll capture. (00:05, 00:75.2, 01:33+)**
Fix: Ensure only one scroll container. Avoid nested `overflow:auto` unless modal content. Remove fixed-height wrappers inside main screen.
29. [S2][W] **Multiple entry creation paths exist (plus button vs scanner button vs camera icon) without a single guided funnel. (00:05–00:23+)**
Fix: Create a unified "Add" flow: choose doc type → choose input mode (camera / PDF / image) → extraction → review → save.
30. [S2][P] **Switching apps (WhatsApp/PDF viewer → Safari) leads to unstable UI states and overlay remnants. (01:16–01:45 and 01:38+)**
Fix: On `visibilitychange` and `pageshow`, reset transient UI (close modals, close action sheets, re-sync route state). Persist draft state server-side so refresh is safe.
31. [S1][D] **Entry form allows "Zinc Ingot Received" with 0 weight, which can later corrupt balances if saved. (01:17.0)**
Fix: Block save if any line item has a non-empty description but all numerical fields are zero/blank. Require deletion or completion.
32. [S1][D] **Save button exists but the system gives no visible validation errors in the UI when data is nonsense. (01:17.0)**
Fix: Implement per-field validation: required, numeric ranges, units; show inline messages; show top summary "Cannot save: 4 issues".
33. [S2][X] **"Found 2 line items" conflicts with the later view showing at least two items but the first is junk. (01:10.2 vs 01:17.0)**
Fix: Count only "valid candidate line items" after sanity filtering; show "2 extracted, 1 requires review".
34. [S2][W] **Job Work "Scan Challan" label exists in one modal state and disappears in later states; inconsistent naming. (00:15.2 shows "Scan Challan")**
Fix: Standardise header actions: always show "Scan/Upload" at the top of an entry form, not only sometimes.

35. [S2][U] **Modal close “X” is small and close to edge; risky on mobile. (00:15.2, 01:06.5, 02:52)**
Fix: Increase hit area to minimum 44×44pt; add “Close” label for accessibility.
36. [S2][U] **Buttons (“Use Camera”, “Upload File”) have huge padding and dashed borders but no explanation; visually heavy. (00:23.5, 01:50+, 02:52)**
Fix: Replace dashed large cards with standard primary/secondary buttons + brief helper text.
37. [S2][E] **Download icon appears on multiple screens but does not show what format, what data, and may not work cross-browser. (00:18.4, PO page 01:33+)**
Fix: Implement a consistent export service: server-generated file, persistent link, and a toast confirming saved; also support CSV.
38. [S0][U] **Bottom navigation overlaps content in some states; content sits behind nav. (00:75.2 and PO screens show cards close to bottom)**
Fix: Apply `padding-bottom` equal to nav height + safe area to every page content wrapper.
39. [S2][U] **Top header occasionally clipped (icons partially offscreen in some captures). (PO page around 01:29–01:33 shows icons near top edge)**
Fix: Use a fixed header with safe-area top padding; avoid negative margins.
40. [S2][U] **Large KPI card dominates screen and pushes list content below fold; increases scrolling load. (Job Work main)**
Fix: Make KPI card collapsible or turn into a compact header summary with a “View dashboard” link.
41. [S2][W] **“Dashboard” button exists but no visible navigation confirmation or loading state is shown. (Job Work KPI card)**
Fix: Add route transition loading indicator and breadcrumb/back.
42. [S1][D] **Job Work total “Total Incoming (Our.WT)” changes after questionable extraction without audit view. (00:05 vs 00:49.9 vs 01:12.7)**
Fix: Add an audit drill-down: show which entries changed totals; include entry IDs, timestamps, and whether draft/confirmed.
43. [S2][F] **iOS file picker opens in different directories (On My iPhone, Downloads, Search) with no in-app guidance. (00:28.4, 00:56.1, 01:41.5, 02:59)**
Fix: Add an instruction panel: “Select a PDF from Files → Downloads/Invoicing folder”. If possible, use the file picker starting location via user education; web cannot fully control it.
44. [S2][F] **Long-press context menus appear in Files (Downloads folder menu) suggesting mis-taps and workflow friction. (00:58.5, 01:41.5)**
Fix: Enlarge tappable targets and reduce need for filesystem navigation by adding “Recent uploads” inside app.
45. [S2][X] **The system accepts images/PDFs that are not invoices/POs (example: screenshots, other docs visible in pickers).**
Fix: Validate document type post-upload; if wrong, reject with message “This does not look like a PO/Invoice”.

46. [S2][X] **No de-duplication step is shown; repeated uploads can create duplicate entries. (Repeated scan/upload behaviours)**
Fix: Compute a document fingerprint (hash + key fields). If duplicate suspected, block and show "This document matches an existing draft/entry".
47. [S1][D] **"Closed" PO filter shows non-closed PO items; filter logic is broken. (02:48.9 / 01:68.9)**
Fix: Define PO status deterministically from received vs ordered and closure flag; filters must query by that computed status only.
48. [S1][D] **PO status badge is inconsistent with metrics (shows "FULFILLED" while progress = 60% and pending exists). (02:09.0 / scene_52_t129.0)**
Fix: Badge must be derived from the same status function used for metrics; remove any hardcoded badge string.
49. [S2][W] **PO cards show progress but there is no obvious tap target indicating drill-down, and chevrons are missing. (PO list)**
Fix: Make entire card clickable and add a chevron or "View details".
50. [S2][U] **PO header actions (download/camera/plus) are icon-only; no labels; too easy to hit wrong action. (01:33.9)**
Fix: Replace with one "Actions" button and a labelled menu.
51. [S2][P] **"AI is analyzing document..." overlays the PO list; no background interactions; if it hangs, user is trapped. (02:36.0)**
Fix: Provide cancel and show job ID; allow leaving screen while processing continues in background; notify when done.
52. [S2][W] **Invoice module uses filters "All / Pending / Needs Review" but the meaning of "Needs Review" is undefined and no review queue explanation exists. (Sales page 03:11)**
Fix: Define "Needs Review" as "confidence below threshold / validation failed / missing required fields"; show a badge count.
53. [S2][W] **Selecting "Needs Review" results in an empty screen with no empty state text. (03:11.0)**
Fix: Add empty state: "No invoices require review" and a button "Show all".
54. [S1][D] **Same invoice card ("Reliance Industries", ₹15,400) appears in contexts that look like both Purchases and Sales. (02:52 and 03:09)**
Fix: Split purchase and sales pipelines. Enforce `document_type` and separate table/collections; never render purchase invoices on sales screens or vice versa.
55. [S2][W] **"Customers" button exists on Sales but not on Purchases; asymmetry without rationale. (03:09)**
Fix: Align modules: Sales has Customers, Purchases has Vendors. Both should be accessible via consistent placement.
56. [S0][U] **Scanner bottom sheet plus Safari UI reduces usable viewport so much that lists become hard to scroll; matches your "cannot scroll down" symptom. (02:42.9 and similar)**
Fix: When scanner modal opens, hide/disable background lists and remove Safari bottom bar

overlap by ensuring the modal is full-height and scrolls internally; provide a dedicated fullscreen capture screen instead of a half-sheet.

57. [S0][W] Final state is a blank white page; no error UI. (03:16+)

Fix: Add fallback renderer and route guards. Any unhandled promise rejection must show an error page.

58. [S2][U] Search field focus triggers keyboard but layout does not adapt; content behind keyboard is not repositioned reliably. (Files picker and in-app search)

Fix: Use `visualViewport` API to adjust bottom spacing when keyboard opens; test on iOS Safari.

59. [S2][U] In Job Work entry, field labels are all-caps and low-contrast; mobile readability issue. (00:15.2)

Fix: Increase label contrast, use sentence case, and tighten spacing.

60. [S2][U] "Rate %" field is placed beside thickness and pcs, but semantically it is different; this invites wrong manual entry. (Entry form)

Fix: Group inputs: "Item identity" (desc, thickness), "Quantity" (pcs, weight), "Zinc %". Use separate row groupings with headings.

61. [S2][W] Entry form does not show unit selection; weight is assumed KG. (Entry form)

Fix: Make unit explicit per field; lock to KG where required; validate ranges.

62. [S2][X] No visible way to view the uploaded document while reviewing extracted fields.

Fix: Add split-view or "View source" button that opens a PDF/image preview with highlight boxes.

63. [S2][X] No confidence scoring visible; user cannot know what is reliable.

Fix: Store and show confidence per field; colour code; route low-confidence items to "Needs Review".

64. [S2][D] No GST/Invoice number/date validation is visible in invoice modules.

Fix: Add validators (format, checksum where applicable) and show validation results inline.

65. [S2][D] No duplicate prevention for challan numbers visible; J/128 can be created multiple times.

Fix: Unique constraint per vendor + challan number + date; show "already exists" warning.

66. [S2][D] Vendor dropdown appears prefilled; may cause accidental wrong vendor if extraction fails. (00:15.2 prefilled "Acme...")

Fix: Default vendor dropdown to empty when extraction confidence < threshold; require selection before save.

67. [S2][W] "Add Row" exists but no guidance about required columns per row.

Fix: Show per-row required markers and a template example.

68. [S2][U] Delete icon appears per row but is visually "dangerous"; no disabled state when only one row remains.

Fix: Disable delete if it would leave entry with zero meaningful items; show "At least one row required".

69. [S2][P] **Large UI updates occur (totals change) without transitional feedback; user cannot trace what happened.**
Fix: After save, show a toast: "Entry saved. Net zinc +X kg". Link to entry details.
70. [S2][E] **Downloaded XLSX name is generic and not contextualised ("JobWork_Challans.xlsx"). (00:18.4)**
Fix: Include date range and filter in filename: `jobwork-challans-2026-04-01-to-2026-04-01.xlsx`.
71. [S2][E] **No export for PO module shown, even though download icon exists; unclear parity.**
Fix: Ensure export exists for each module and shows schema and filters.
72. [S2][U] **KPI typography is oversized relative to other elements; causes layout imbalance on small screens.**
Fix: Responsive typography scaling using clamp().
73. [S2][U] **Contrast issues in tabs (inactive tabs too similar to background).**
Fix: Use stronger active indicator: underline + bold + colour.
74. [S2][W] **Two-tier filters + search in Job Work make the state hard to understand (which tab impacts what list).**
Fix: Show breadcrumb state: "Job Work > Incoming > Challan Register".
75. [S2][W] **No global date filter visible in Job Work; totals appear "all-time" but are not labelled as such.**
Fix: Add date range selector affecting KPIs and lists.
76. [S2][X] **"Extraction Complete" does not report what document type it detected. (01:50_t110.2)**
Fix: Show "Detected: Challan / PO / Invoice" with confidence.
77. [S2][F] **Upload pipeline does not show which file was selected (filename not visible during scanning).**
Fix: Show filename, size, page count at the top of scanning modal.
78. [S2][F] **No file size limits shown; large PDFs could fail silently.**
Fix: Enforce max size and show clear errors: "PDF too large; compress or select fewer pages."
79. [S0][P] **System can land in a trapped state after returning from iOS pickers (stale overlays). (00:35.7, 00:98.4)**
Fix: On return from picker, re-render the page and close any stale sheets; treat picker as a route-like transition.
80. [S2][U] **Some UI elements appear clipped near top edges during transitions (black bar region).**
Fix: Use safe-area top padding and avoid absolute positioning for headers.
81. [S2][W] **Job Work list card shows job IDs (J/54 etc) but there's no explanation if that is challan number, job number, or internal ID.**
Fix: Label it explicitly ("Job ID" vs "Challan No").

82. [S2][D] Job Work dashboard formula uses “Rate %” without clarifying whether it is zinc %, coating %, or shrinkage %.
Fix: Rename field explicitly to “Zinc consumption %”.
83. [S2][D] Entry form includes “Lorry No” but placeholder says “Vehicle No”; inconsistent terminology. (00:15.2)
Fix: Standardise to one term across UI and export fields.
84. [S2][W] PO list “Open/Partial/Closed” control can show “Closed” selected while the list appears unchanged. (02:48.9)
Fix: Control must re-query and re-render list; show loading indicator; show “0 results” if none.
85. [S2][U] PO cards are information-dense; on mobile they are tall and require heavy scrolling.
Fix: Use compact mode with expandable details; show only PO number, vendor, status, ordered/received/pending.
86. [S2][U] PO number wrapping produces awkward line breaks and truncation.
Fix: Use a monospaced or smaller font for long IDs; allow horizontal scroll on ID chip.
87. [S2][W] Invoices list has no visible “Add manual invoice” path; only camera/scanner is prominent.
Fix: Add “+ New invoice” with options: manual, scan, upload.
88. [S2][X] Extraction system does not flag “this output is low quality”; instead it presents numbers as if correct.
Fix: Require extraction confidence gating and a mandatory review step when below threshold.
89. [S1][D] Entry row calculates zinc consumed from weight and percent even when percent may be wrong, creating false precision. (01:17.0 shows exact 114.70 KG)
Fix: When percent is extracted (not configured), show it as “unverified” and exclude from confirmed totals until verified.
90. [S2][W] No indication of who created/edited an entry, time stamp, or audit trail.
Fix: Add metadata: created at, created by, source type (scan/upload/manual), last edited.
91. [S2][W] No “drafts” area to manage failed/messy extractions; user is forced to deal with rubbish inside live screens.
Fix: Create “Drafts / Needs Review” queue per module.
92. [S2][P] No retry step on analysis failures; user must re-upload if something goes wrong.
Fix: Provide retry from cached upload; store upload temporarily server-side.
93. [S2][F] Files picker sessions are long and multi-step; app gives no in-flow breadcrumb after returning.
Fix: After selecting file, show a short confirmation screen: “Selected: <filename>”.
94. [S3][U] Inconsistent colour semantics: orange sometimes means action, sometimes status; green used for camera and also confirmation.
Fix: Define a strict design token system: Primary action, Secondary action, Danger, Success, Warning, Info.

95. [S3][U] **Mixed typography weights: headers bold, cards heavy, labels faint; inconsistency hurts readability.**
Fix: Adopt a type scale (H1/H2/body/label) and reuse components.
96. [S3][W] **The app is used in Safari with address bar visible, which reduces space and increases interaction friction.**
Fix: Provide an install-as-PWA prompt and optimised PWA manifest; or ship a native wrapper.
97. [S2][E] **Exports are downloaded via Safari prompt; no integration with “Files” save location selection.**
Fix: After server generates export, open iOS share sheet via a user gesture (where possible) or provide instructions and an in-app “Open in Files” link.
98. [S2][X] **PO scanning appears to “finish” but the PO list view does not clearly show a newly added PO entry or highlight. (02:41 after analysis)**
Fix: After successful parse, highlight the newly created PO at top with “New” badge and auto-scroll to it.
99. [S2][W] **No “success/failure” toast after PO import; only analysis modal disappears.**
Fix: Add explicit “PO imported” message with link to details.
100. [S0][U] **Multiple moments show the Safari UI overlays the app while a bottom sheet is open, shrinking interactive area and causing scroll lock symptoms. (00:35.7, 02:42.9)**
Fix: Redesign scanner as a full-screen route (not a half bottom-sheet) on mobile.
101. [S1][D] **“Closed” filter showing items with pending quantities risks operational mistakes (treating open POs as closed). (02:48.9)**
Fix: Enforce status accuracy; add warning if any PO shows pending > 0 but status “Closed”.
102. [S2][W] **No confirmation before committing entries that change zinc KPIs.**
Fix: Add confirmation step: “This will increase zinc consumed by X and net balance by Y. Confirm?”
103. [S2][W] **No role separation exists (admin vs operator) visible; high-risk actions (delete, export) appear for everyone.**
Fix: Add basic RBAC even if single-user initially; at minimum provide “Are you sure?” confirmations.
104. [S2][P] **App relies heavily on stateful UI; when interrupted by app switching it becomes unstable.**
Fix: Persist transient state (draft) server-side; keep UI idempotent; allow refresh without losing state.
105. [S2][X] **Zinc statement-type documents contain multiple rows and should map to “analysis ledger”, not to “incoming challan entry”. The current workflow lacks a dedicated “Zinc Statement import” path.**
Fix: Add a “Zinc Statement” module: parse rows into analysis table; compute balances; do not mix into challan/invoice line items.

106. [S3][U] Placeholder “e.g. CH-2024-001” does not match your actual challan numbering format shown later (J/128). (00:15.2 vs 00:67.3)
Fix: Update placeholders to match actual; support both formats but show examples from your domain.
107. [S2][W] Users can access scanner from multiple modules but the scanner modal looks identical; it is not obvious which module it will import into. (Job Work vs PO vs Invoices)
Fix: In scanner modal header, show “Import into: Job Work / PO / Purchases / Sales”.
108. [S2][X] Scanner says “Extracting line items and values” even for documents that are not line-item invoices (e.g., statements) which misleads users.
Fix: Post-classification, update copy dynamically: “Extracting PO header and items”, “Extracting challan rows”, “Extracting statement rows”.
109. [S0][W] Blank white screen at the end suggests a route crash or missing component render for Sales sub-route or scanner return path. (03:16+)
Fix: Add route-level fallback UI and ensure all async data fetches have loading/error/empty states.
110. [S2][U] Sales “Needs Review” tab shows a near-empty screen with no list container boundary; users interpret it as broken rather than empty-by-design. (03:11)
Fix: Always render list container skeleton and show explicit empty-state copy.

Root-cause patterns driving the failures

The issues above cluster into a small number of underlying causes:

The app is being operated as a Safari web app on iOS, but the layout behaves like a desktop/Android viewport. Without `100dvh`, safe-area padding, and a single scroll container, scrolling and fixed footers will fail intermittently.

Modal and bottom-sheet state is not managed centrally, so returning from system pickers creates stacked/partial overlays. This directly produces the “cannot scroll” symptom.

Extraction results are being treated as authoritative immediately. There is no confidence gating, no document-type routing, no draft/confirm barrier, and no validation lock. That is why “rubbish” data can still alter zinc balances.

PO status logic is inconsistent with computed progress, and filters are not connected to status definitions. That makes “Closed” unreliable.

Error handling is missing (blank screens) because there is no global error boundary and no user-facing fallback.

Patch plan structured for correctness first

S0 blockers first: unify scrolling, fix safe areas, implement modal manager, add error boundary, stop auto-posting extraction into totals, and stop blank screens.

S1 critical next: document type classification, draft-only creation, validation gating, vendor confirmation, PO status correctness.

S2 major next: guided import funnel, consistent action menu, empty states, progress/cancel, audit trails.

S3 final: polish, copy consistency, typography, colour semantics.

Final consolidated “no-surprises” build prompt to regenerate the app correctly

Use the following as the single master prompt for your code generator. It is written to eliminate the exact failure modes visible in the recording (scroll lock, modal stacking, rubbish extraction, wrong totals, broken PO filters, blank screens).

MASTER PROMPT FOR REBUILD/REFACTOR

Build a production-grade iOS-first mobile web app (Safari + installable PWA) for accounting modules: Job Work (Challan/Incoming + Labour), Purchases, Sales, Purchase Orders, and Zinc Statements/Analysis. The app must be deterministic, auditable, and must never commit extracted data into totals without user confirmation.

NON-NEGOTIABLE UI FOUNDATIONS (MOBILE SAFARI): - Implement a single scrolling architecture: - `body` must not scroll; `body { overflow: hidden; }` - a single `.app-scroll` container must scroll with `overflow-y: auto; -webkit-overflow-scrolling: touch; height: 100dvh;` - Use dynamic viewport units everywhere: - never use `100vh`; use `100dvh` - Apply safe-area insets: - every fixed header/footer and bottom nav must include `padding: env(safe-area-inset-*)` - every screen content wrapper must include bottom padding equal to (bottom nav height + safe-area) - No stacked modals: - implement a global ModalManager ensuring only one modal/sheet is open at a time - on route change, visibility change (`visibilitychange`), and return from file picker, force-close transient sheets and rehydrate state cleanly - Add a global error boundary: - no blank screens are allowed - on error, show a recovery UI with “Reload module” and log details

UNIFIED “IMPORT DOCUMENT” FUNNEL (ALL MODULES): - Replace scattered icons with one “Actions” button per module opening a labelled sheet: - Scan with Camera - Upload PDF - Upload Image - Manual Entry - Export - Scanner must be full-screen on mobile (not a half bottom-sheet) to avoid scroll lock and Safari overlay collisions - During import show: - filename, size, page count - progress steps: Upload → OCR/Text Extract → Parse → Validate → Ready for Review - Cancel must actually cancel server processing and clear UI state safely - After import, always land on a REVIEW SCREEN (not directly on live lists)

DOCUMENT TYPE CLASSIFICATION (MANDATORY): - Before parsing, classify the document into exactly one: 1) Job Work Challan (incoming/outgoing) 2) Labour invoice 3) Purchase invoice 4) Sales invoice 5) Purchase order 6) Zinc statement / zinc consumption analysis 7) Unknown (requires user selection) - If classification confidence is low, force user selection and do not guess

EXTRACTION RULES (ANTI-RUBBISH GUARANTEES): - Extraction output must include for every field: - value - confidence score 0–100 - source page and bounding box reference (or text span reference for digital PDFs) - Apply sanity filters: - discard any “line item” where all numeric fields are empty/zero -

never create a line item from a header label - Never auto-assign vendor/customer unless confidence $\geq$ threshold; otherwise show candidates and require selection - Never auto-post extracted documents into totals: - create a DRAFT record only - drafts do not affect KPIs, balances, fulfilment, or ledger - Enforce validation gates on Save: - challan/invoice/PO numbers required (where applicable) - date required and normalised - at least one valid line item (non-zero meaningful quantities) - numeric fields must be within safe ranges - if required fields missing: block save and show a top summary + inline errors

JOB WORK MODULE (CORRECTNESS): - Separate submodules: - Challan Register (incoming/outgoing) - Vendor Balance - Labour Cost - Zinc computation: - zinc consumed = $(\text{confirmed weight} \times \text{configured zinc\%})/100$ - zinc% must come from a controlled rate table (vendor $\times$ item category $\times$ thickness range); extracted zinc% is "unverified" until approved - KPIs must show: - Confirmed totals - Draft totals (separate and not merged) - Every KPI change must be traceable: - audit log view listing entries affecting totals

ZINC STATEMENT / ANALYSIS MODULE (MUST EXIST): - Import zinc statements as a dedicated dataset: - each row becomes an analysis row with date, item, qty, zinc%, zinc consumed - do not treat statement rows as challan/invoice items - Provide balances: - zinc sent, zinc consumed, zinc received/returned, net balance - vendor-wise rollups

PURCHASE ORDERS MODULE (STATUS MUST BE RIGHT): - PO status must be computed from ordered vs received vs close flag: - Open: received = 0 and not closed - Partial: $0 < \text{received} < \text{ordered}$ and not closed - Fulfilled: received $\geq$ ordered and not closed - Closed: close flag true (must not show pending > 0 without warning) - Filters Open/Partial/Closed must strictly match computed status - After PO import: - show explicit success toast and highlight the new PO

PURCHASES AND SALES MODULES (SEPARATION): - Purchases and Sales must be separate pipelines and storage: - a purchase invoice must never render in Sales and vice versa - Lists must include: - All / Pending / Needs Review - Needs Review is defined as: confidence below threshold OR failed validations OR missing required fields - Empty states must be explicit (never a blank page)

EXPORTS: - Exports must be explicit about scope: - current filters + date range - Generate server-side exports and return a stable downloadable link - Show "Export ready" confirmation; include contextual filename

RELIABILITY REQUIREMENTS: - No silent failures: - every async action has loading, success, error states - After returning from iOS file picker: - UI must rehydrate without stacked modals, without broken scroll - Implement automated checks: - end-to-end tests for: scroll, modal open/close, upload, cancel, review, save, filter correctness, no blank screens

OUTPUT: - Deliver code that is mobile-first stable on iOS Safari and installable as a PWA. - Prioritise correctness and auditability over automation. - Do not allow any extracted data to affect balances until user confirms after validation.
